

Google Sheets + Calendar

Preparation checklist - send requirements, not passwords

Suitable workflows: ClinicGPT, eduGPT and BusinessGPT scheduling with records

What this can enable

Keep appointment records linked to calendar bookings using an agreed unique reference. Features go live only after configuration, approval and successful testing.

What to prepare

1. Both spreadsheet/tab details and calendar owner/ID; use fictional sample records.
2. Map the unique booking ID, customer fields, appointment time and status columns.
3. Define which system is authoritative for availability and booking status.
4. Agree booking, cancellation, retry and reconciliation behaviour; approve a test slot.

Scope and exclusions

This is a combined workflow, not two independently confirmed bookings. Medical/student histories and identity checks require explicit additional scope. Do not assume both individual fees automatically cover synchronisation.

Setup and ongoing costs

Combined scope: quotation required. One-time estimate, not an automatic charge. Final scope and price require your written approval before work begins.

Agreed setup covers configuration, field mapping, controlled tests and handover for the named workflow. Bot subscription, taxes, provider API/transaction fees, extra workflows and ongoing maintenance are separate unless included in your quotation.

Next step

Email the non-secret checklist details to info@aifrogi.com or call +91-7410582898. We confirm scope and permissions, connect securely, test with your approval, then enable the workflow. Never email passwords, API secrets, OTPs or real sensitive customer records.
